CLARICEPTIFY | AN ONTOLOGY OF CONCEPTUALIZATION

R1 REVIEW CANDIDATE | 137 concepts | 174 associations | 122 generalizations | 20 subject domains + Foundations | diagram-r1.2 | 25 October 2026

Complete vector view; zoom required. Domain colors are not stereotypes. Scientific acceptance not established; native OntoUML validation not assessed.

DOMAIN COLOURS, DEFINITIONS AND CONCEPT COUNTS

Conceptualization (9)
The formation and articulation of an explicit, purpose-oriented account of a subject.

Relations (5)
Descriptions of connections and attributed characteristics among conceptual elements.

Terminology (10)
Terms, definitions and their systematic organization for a selected subject.

Metaphysics (3)
General categories of being, state, change and temporal organization relevant to a subject.

Foundations (6)
A cross-domain support layer of general categories required for UFO-grounded typing.

Intentionality (4)
The goal-directed orientation of agents and the content guiding their choices.

Representation (12)
Forms and conventions through which conceptual content is externally expressed.

Metamodeling (4)
Models and activities that describe modeling constructs and classification levels.

Knowledge (1)
Articulable content about a subject that can inform understanding and conceptual choices.

Cognition (13)
Mental activities and states involved in attending to, interpreting and understanding a subject.

Modeling (17)
Activities and artifacts that express selected aspects of a subject as structured models.

Taxonomy (3)
Formation, application and hierarchical organization of conceptual categories.

Quality (5)
Criteria for judging the semantic adequacy and internal integrity of conceptual artifacts.

Abstraction (6)
The selection of relevant characteristics and organization of descriptions across levels of generality.

Structure (6)
Organization of conceptual elements, including part-whole descriptions.

Logic (4)
Formal expression, adopted assertions and restrictions on admissible interpretations.

Evaluation (4)
Activities and explicit criteria used to examine conceptual artifacts.

Semantics (7)
Meaning, interpretation and conditions for compatible understanding of representations.

Language (12)
Systems and activities for expressing and communicating content through signs and rules.

Ontology (1)
Explicit assumptions about the entities and relations admitted in a conceptual account.

Provenance (5)
Origins, supporting information and assumptions associated with conceptual content.

Solid line: association, navigability unspecified. Hollow triangle: generalization pointing to the supertype; no multiplicities on generalizations.
Association multiplicities count instances at their own class end. Crossings are not junctions. Fine grey leaders attach moved labels to their original locations.
Generalizations may share a hollow parent arrowhead. Shared arrowheads assert neither disjointness nor completeness of the subclasses.
Concept, Relation, Property and Instance are information descriptions. Relation is not automatically a UFO relator; part-whole descriptions do not assert UML composition.
Coverage and connector checks passed. Formal OntoUML/UFO satisfiability and expert semantic validation remain open. Read the specification for the 24 semantic constraints.
Notation reference: OntoUML Vocabulary v1.1.1 (https://dev.ontouml.org/ontouml-vocabulary/). Generalization and association use UML connector conventions.
